Incorporating corrigendum November 2014

BSI Standards Publication

Cycles — Safety requirements for bicycles

Part 4: Braking test methods (ISO
4210-4:2014)

National foreword

This British Standard is the UK implementation of EN ISO 4210-4:2014. Together with BS EN ISO 4210-1:2014, BS EN ISO 4210-2:2014, BS EN ISO 4210-3:2014, BS EN ISO 4210-5:2014, BS EN ISO 4210-6:2014, BS EN ISO 4210-7:2014, BS EN ISO 4210-8:2014, BS EN ISO 4210-9:2014 it supersedes BS EN 14764:2005, BS EN 14766:2005 and BS EN 14781:2005, which are withdrawn.

The UK participation in its preparation was entrusted to Technical Committee GME/25, Cycles.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

This European Standard was approved by CEN on 21 June 2014.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

Foreword

This document (EN ISO 4210-4:2014) has been prepared by Technical Committee ISO/TC 149 "Cycles" in collaboration with Technical Committee CEN/TC 333 "Cycles" the secretariat of which is held by UNI.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by January 2015, and conflicting national standards shall be withdrawn at the latest by July 2015.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

This document supersedes EN 14764:2005, EN 14766:2005, EN 14781:2005.

This document has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association.

According to the CEN-CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Endorsement notice

The text of ISO 4210-6:2014, Corrected version 2014-11-01 has been approved by CEN as EN ISO 4210-6:2014 without any modification.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information](#)

The committee responsible for this document is ISO/TC 149, *Cycles*, Subcommittee SC 1, *Cycles and major sub-assemblies*.

This first edition of ISO 4210-4, together with ISO 4210-1, ISO 4210-2, ISO 4210-3, ISO 4210-5, ISO 4210-6, ISO 4210-7, ISO 4210-8, and ISO 4210-9, cancels and replaces ISO 4210:1996, which has been technically revised.

ISO 4210 consists of the following parts, under the general title *Cycles — Safety requirements for bicycles*:

- *Part 1: Terms and definitions*
- *Part 2: Requirements for city and trekking, young adult, mountain and racing bicycles*
- *Part 3: Common test methods*
- *Part 4: Braking test methods*
- *Part 5: Steering test methods*
- *Part 6: Frame and fork test methods*
- *Part 7: Wheels and rims test methods*
- *Part 8: Pedals and drive system test methods*
- *Part 9: Saddles and seat-post test methods*

This corrected version of ISO 4210-4:2014 incorporates a date's change in 4.6.1, 4.6.3.6, 4.6.3.9, 4.6.3.10, 4.6.3.11 and 4.6.5.7 e) and two technical corrections in [Annex A](#).

Introduction

This International Standard has been developed in response to the demand throughout the world. The aim is to ensure that bicycles manufactured in compliance with this International Standard will be as safe as is practically possible. The tests are designed to ensure the strength and durability of individual parts as well as of the bicycle as a whole, demanding high quality throughout and consideration of safety aspects from the design stage onwards.

The scope is limited to safety considerations, and has specifically avoided standardization of components.

If the bicycle is to be used on public roads, national regulations apply.

For the purpose of improvement of repeatability and reproducibility, and considering the applicability to all types of bicycle and the size and influence of the operator, the machine test method reflects today's state of the art and is preferred to the track test method.

Unless there is evidence of improvement of the test track method in the future, make this method informative for the next revision. Users of this International Standard are invited to provide their feedback to the ISO/TC 149/SC 1.

Cycles — Safety requirements for bicycles —

Part 4: Braking test methods

1 Scope

This part of ISO 4210 specifies the braking test methods for ISO 4210-2.

2 Normative references

The following referenced documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 4210-1, *Cycles — Safety requirements for bicycles — Part 1: Terms and definitions*

ISO 4210-2:2014, *Cycles — Safety requirements for bicycles — Part 2: Requirements for city & trekking, young adult, mountain and racing bicycles*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 4210-1 apply.

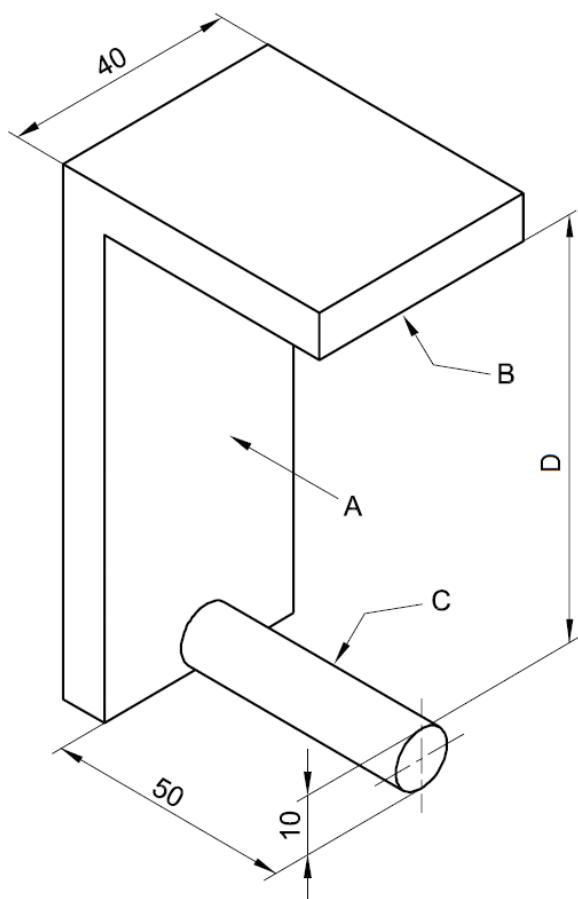

4 Test methods

4.1 Brake lever grip dimensions

4.1.1 Test method for the brake lever similar to type A or type B

Fit the gauge illustrated in [Figure 1](#) over the handlebar grip or the handlebar (when the manufacturer does not fit a grip) and the brake lever as shown in [Figure 2](#) so that face A is in contact with the handlebar or grip and the side of the brake lever. Ensure that face B spans an area of that part of the brake lever which is intended for contact with the rider's fingers without the gauge causing any movement of the brake lever towards the handlebar or grip. Measure the distance, a , the distance between the last part of the lever intended for contact with the rider's fingers and the end of the lever. The measurement should be conducted only on a fully assembled bicycle.

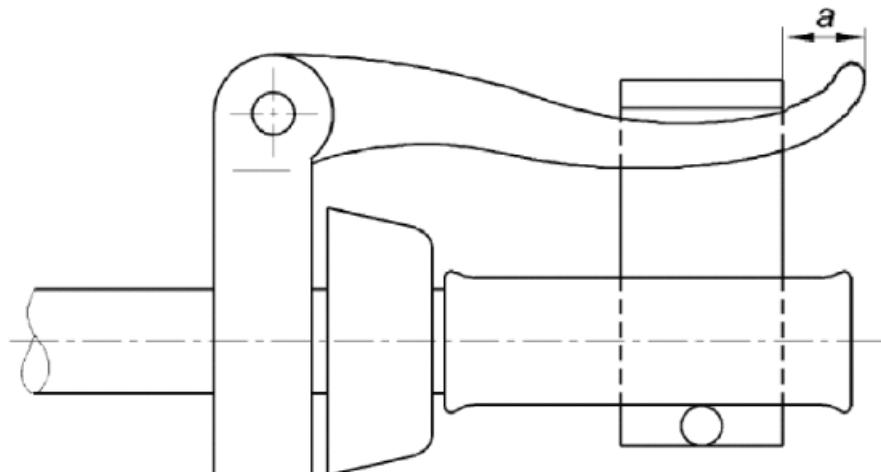

Dimensions in millimetres

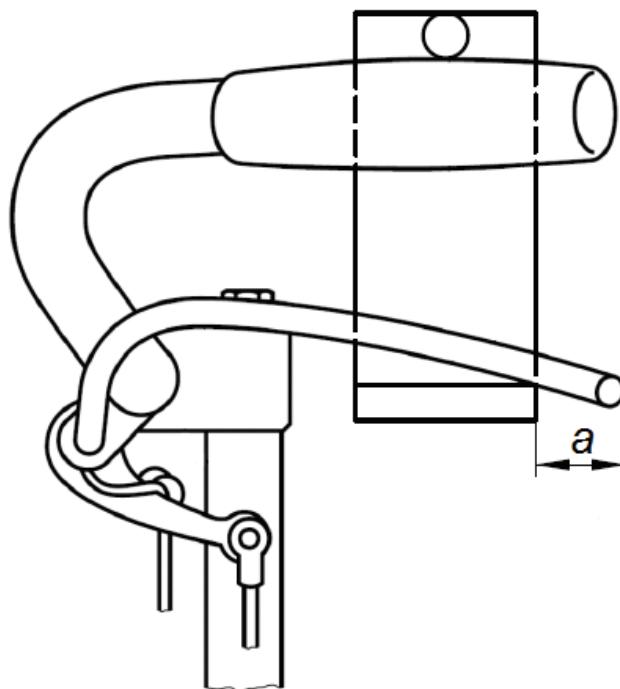

Key

- A face A
- B face B
- C rod
- D 75 mm or 90 mm

Figure 1 — Brake lever grip dimension gauge for type A and type B

a) Type A

b) Type B

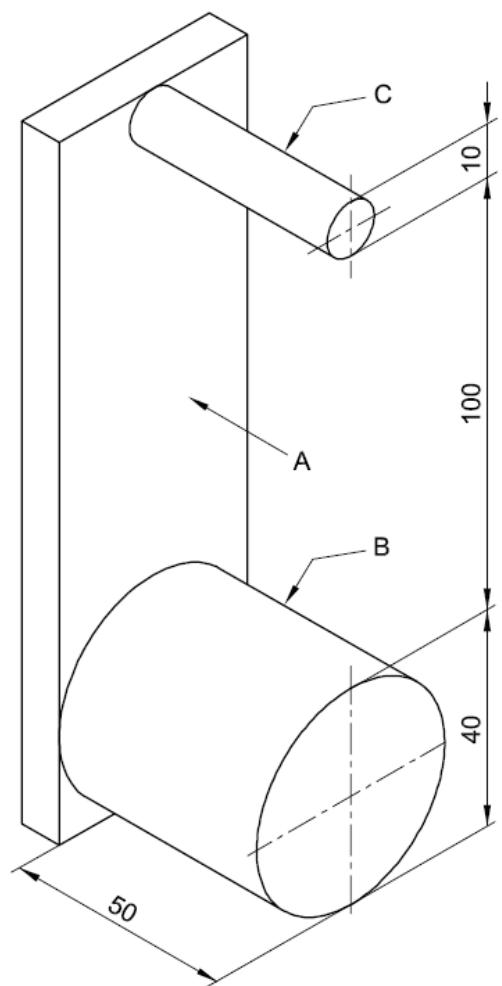

NOTE Minimum grip length is shown.

Figure 2 — Method of fitting the gauge to the brake lever and handlebar

4.1.2 Test method for the brake lever similar to type C

Fit the gauge illustrated in [Figure 3](#) over the handlebar and brake lever as shown in [Figure 4](#) so that face A is in contact with the handlebar or handlebar grip and the brake lever. Put the face of cylinder B in contact with the part of the grip intended for contact with the rider's hand and check if the requirements are met.

Figure 3 — Brake lever grip-dimension gauge for type C

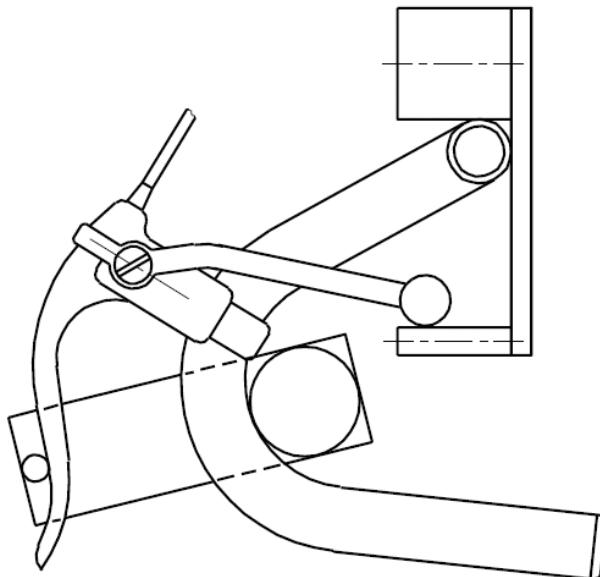

Figure 4 — Method of fitting the gauge to the brake lever and handlebar for type C

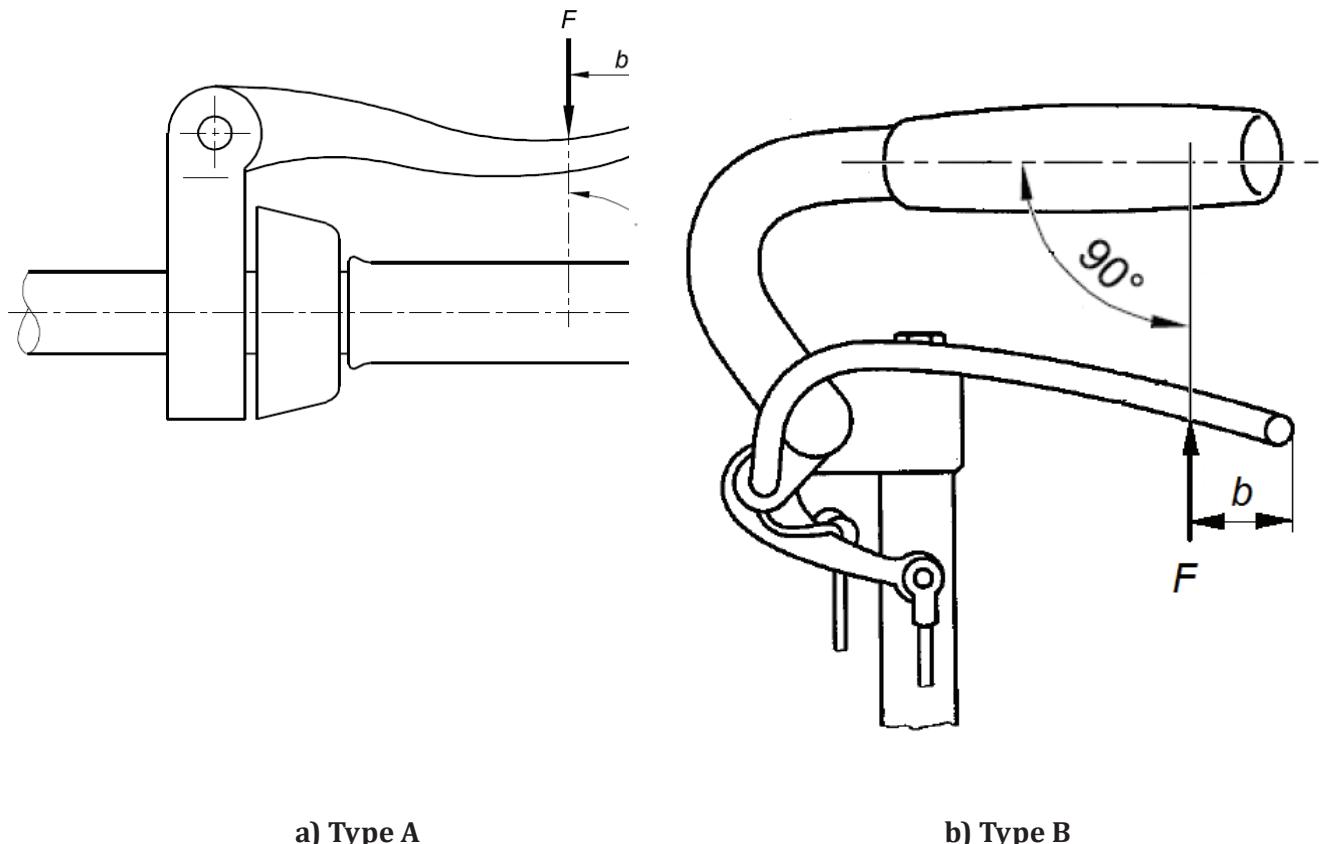

4.2 Brake levers — Position of applied force

4.2.1 Type A and B brake levers

For the purposes of braking tests in this part of ISO 4210, for brake levers similar to type A or type B, the test force shall be applied at a distance b , which is equal to either dimension a [see ISO 4210-2:2014, Figure 2 a) and b)] as determined in [4.1.1](#) or 25 mm from the free end of the brake lever, whichever is the greater [see [Figure 5 a\)](#) and [Figure 5 b\)](#)].

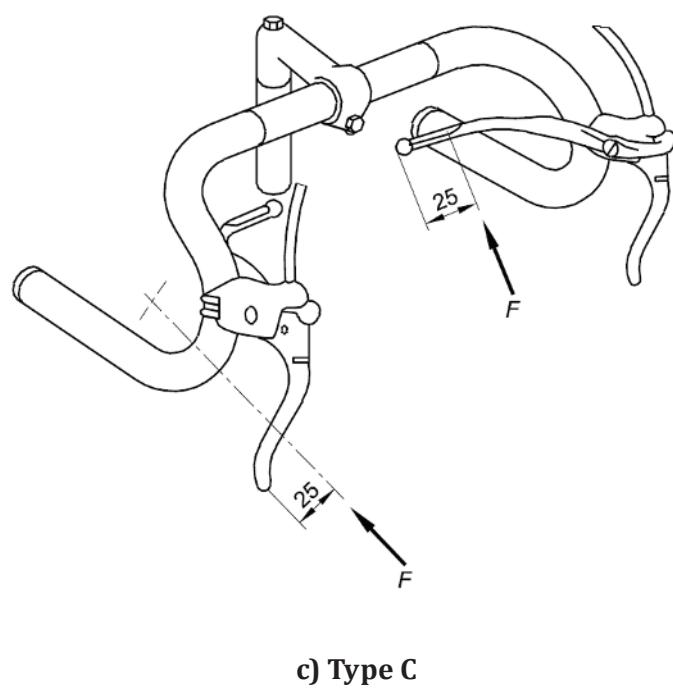

4.2.2 Type C brake levers

For the purposes of braking tests in this part of ISO 4210, for brake levers similar to type C, the test force shall be applied at a distance of 25 mm from the free end of the brake lever [see [Figure 5 c](#)].

a) Type A

b) Type B

c) Type C

Key

- F applied force
 b ≥ 25 mm

Figure 5 — Position of applied force on the brake lever

4.3 Brake-block and brake-pad assemblies — Security test

Conduct the test on a fully assembled bicycle with the brakes adjusted to a correct position with a rider or equivalent mass on the saddle. The combined mass of the bicycle and rider (or equivalent mass) shall be 100 kg.

Actuate each brake lever with a force of 180 N applied at the point specified in [Figure 5](#) or a force sufficient to bring the brake lever into contact with the handlebar grip, whichever is lesser. Maintain this force while subjecting the bicycle to five forward and five rearward movements, each of which is not less than 75 mm distance.

Then conduct the test described in [4.4](#) or [4.5](#) as appropriate, depending on the style of brake, and then the test described in [4.6](#).

4.4 Hand-operated braking-system — Strength test

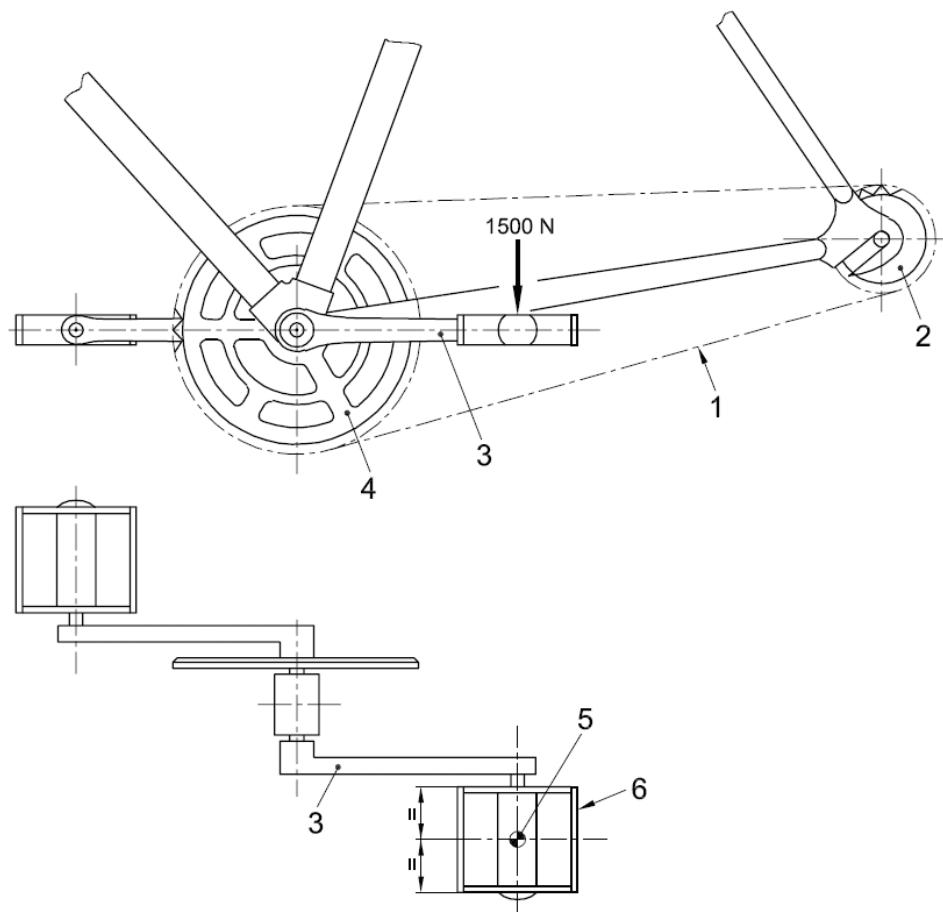

Conduct the test on a fully assembled bicycle. After it has been ensured that the braking system is adjusted according to the recommendations in the manufacturer's instructions, apply a force to the brake lever at the point specified in [Figure 5](#). This force shall be 450 N, or such lesser force as is required to bring

- a brake lever into contact with the handlebar grip or the handlebar where the manufacturer does not fit a grip,
- a brake extension lever level with the surface of the handlebar or in contact with the handlebar, and
- a secondary brake lever to the end of its travel.

Repeat the test 10 times on each brake lever, secondary brake lever, or extension lever.

4.5 Back-pedal braking system — Strength test

Conduct the test on a fully assembled bicycle. After it has been ensured that the braking system is correctly adjusted, and with the pedal cranks in a horizontal position, as shown in [Figure 6](#), apply a vertically downward force to the centre of the left-hand pedal spindle. Increase the force progressively to 1 500 N and maintain fully for 1 min.

Key

- 2 hub sprocket
- 3 non-drive side crank
- 4 cycle chain wheel and pedal crank
- 5 point of force application
- 6 pedal

Figure 6 — Back-pedal brake test

4.6 Braking performance

4.6.1 Test bicycle

Conduct the braking performance test on a fully assembled bicycle after the brakes have been subjected to the strength test detailed in ISO 4210-2:2014, 4.6.6, and 4.6.7. Before testing the bicycle by either method, inflate the tyres and adjust the brakes according to the manufacturer's instructions. In the case of rim-brakes, adjust it to the maximum clearance specified by the manufacturer.

4.6.2 Secondary brake levers

Where a bicycle is fitted with secondary brake levers attached to brake levers, bar-ends, or aerodynamic extensions, separate tests shall be conducted for the operation of the secondary brake levers in addition to tests with the normal levers.

4.6.3 Track test method

4.6.3.1 Test track

- a) Use an indoor test track if possible. If an outdoor test track is used, pay special attention to ambient conditions throughout the test.
- b) The gradient of the track shall not exceed 0,5 %. If the gradient is less than 0,2 % carry out all runs in the same direction. If the gradient lies between 0,2 % and 0,5 %, carry out alternate runs in opposite directions.
- c) The surface shall be hard, of concrete or fine asphalt, and free from loose dirt or gravel. The minimum coefficient of friction between the dry surface and the bicycle tyre shall be 0,75.
- d) The track shall be essentially dry at the commencement of tests. When testing to the requirements of [4.6.3.6](#), the track shall remain dry throughout the tests.
- e) The wind speed on the track shall not exceed 3 m/s during the tests.

4.6.3.2 Instrumentation

The test bicycle or the test track shall be instrumented to include the following:

- a) a calibrated speedometer or tachometer (accurate to within $\pm 5\%$) to indicate to the rider the approximate speed at the commencement of braking;
- b) a velocity-recording device (accurate to within $\pm 2\%$) to record the velocity at the commencement of braking;
- c) a distance recording system (accurate to within $\pm 1\%$) to record the braking distance;
- d) a water spray system, to provide wetting of the braking surface, consisting of a water reservoir connected by tubing to a pair of nozzles at the front wheel and a pair of nozzles at the rear wheel. A quick-acting on/off valve shall be included for control by the rider. Each nozzle shall provide a flow of water at ambient temperature of not less than 4 ml/s. Details of the positions and directions of nozzles for rim brakes, hub brakes, band brakes, disc brakes, and back-pedal brake are given in [Figures 7 to 13](#);

NOTE [Figures 7](#) and [8](#) for rim brakes show side-pull callipers but the same arrangements apply to centre-pull callipers and cantilever brakes.

- e) a brake-actuation indicating system to record independently when each lever or pedal is actuated.

4.6.3.3 Mass of bicycle, rider, and instrumentation

The combined mass of the bicycle, the rider, and the instrumentation shall be 100 kg.

When wet condition braking tests are performed, the combined mass can decrease throughout the test due to water consumption, but it shall not be less than 99 kg at the end of the valid test runs.

Where a manufacturer specifies that their bicycle can carry a mass such that the sum of that mass plus the mass of the bicycle is in excess of 100 kg (60 kg for young adults) to some value M , apply M as total weight.

Any extra weight shall be positioned above the rear wheel and in front of the rear axle.

4.6.3.4 Force applied to the brake levers

- a) Magnitude and position of force on brake levers

Apply a handgrip force not exceeding 180 N at the point as specified in [Figure 5](#). Check before and after each series of test runs to verify the lever force.

b) Optional brake-force application device

It is permissible to use a test mechanism to operate the brake lever, and when such a device is used, it shall meet the requirements of [4.6.3.4](#) item a) and shall additionally control the rate of application of the brake lever force such that 63 % of the intended lever force is applied in not less than 0,2 s.

4.6.3.5 Running — in the braking surfaces

A running-in process shall be conducted on every brake before performance testing is carried out.

Apply the brakes for not less than 3 s to maintain steady deceleration while the bicycle is being ridden at a speed of approximately 16 km/h. Repeat this operation 10 times.

4.6.3.6 Test method — Test runs under dry conditions

Pedal the test bicycle until the specified test velocity is attained (see ISO 4210-2:2014, Table 2). Then stop pedalling and apply the brakes. The bicycle shall be brought to a smooth, safe stop [see ISO 4210-2:2014, 4.6.8.2 item a)].

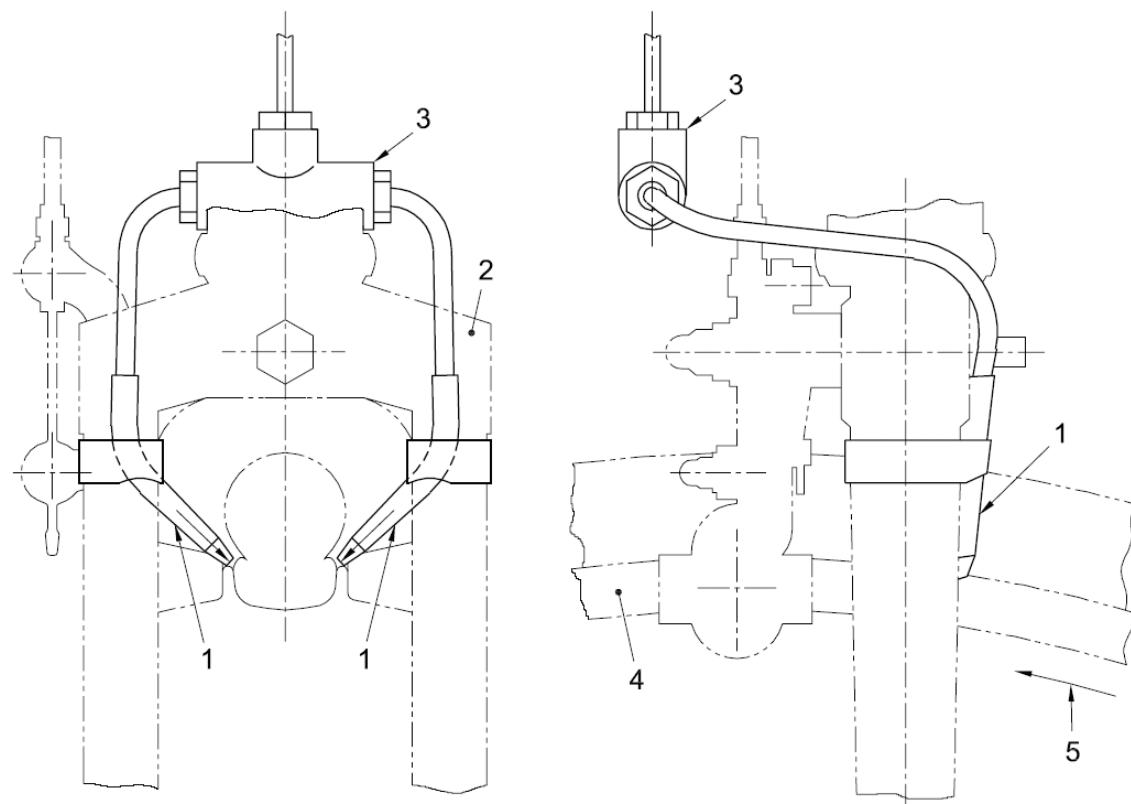

4.6.3.7 Test method — Test runs under wet conditions

The method shall be as given in [4.6.3.6](#), with the addition that wetting of the brake system(s) shall commence not less than 25 m prior to the commencement of braking and shall continue until the bicycle comes to rest. Excessive amounts of water can be swept from the test track surface between runs.

4.6.3.8 Number of valid test runs

- a) If the gradient of the track is less than 0,2 %, the following runs shall be made:
 - 1) five consecutive valid runs under dry conditions;
 - 2) two acclimatization runs under wet conditions (results not recorded);
 - 3) five consecutive valid runs under wet conditions.
- b) If the gradient of the track lies between 0,2 % and 0,5 %, the following runs shall be made:
 - 1) six consecutive valid runs under dry conditions with alternate runs in opposite directions;
 - 2) two acclimatization runs under wet conditions (results not recorded);
 - 3) six consecutive valid runs under wet conditions with alternate runs in opposite directions.

A rest period not exceeding 3 min can be taken between successive runs.

4.6.3.9 Velocity/distance correction factor

A correction factor shall be applied to the measured braking distance if the velocity as checked by the timing device is not precisely as specified in ISO 4210-2:2014, 4.6.8.1.1.

The corrected braking distance shall be determined from Formula (1):

$$S_c = \left(\frac{V_s}{V_m} \right)^2 \times S_m \quad (1)$$

where

S_c is the corrected braking distance (m);

S_m is the measured braking distance (m);

V_s is the specified test velocity (m/s);

V_m is the measured test velocity (m/s).

4.6.3.10 Validity of test runs

- a) A test run shall be considered invalid if
 - 1) excessive side-skid causing the rider to put his foot to the ground to retain control occurs, or
 - 2) loss of control occurs.

With certain types of braking system, it might not be possible to avoid entirely some skidding of the rear wheel during braking. This is considered acceptable provided that 1) or 2) above do not occur as a result.

- b) If the corrected braking distance exceeds the braking distance specified in ISO 4210-2:2014, Table 2, a test run shall be considered invalid if the velocity at the commencement of the test exceeds the specified test velocity by more than 1,5 km/h as specified in ISO 4210-2:2014, Table 2.
- c) If the corrected braking distance is less than the braking distance specified in ISO 4210-2:2014, Table 2, a test run shall be considered invalid if the velocity at the commencement of braking is more than 1,5 km/h below the specified test velocity.

If the corrected braking distance exceeds the braking distance specified in ISO 4210-2:2014, Table 2, the test run shall be considered valid.

4.6.3.11 Test results

- a) Braking under dry conditions

Depending on the gradient of the test track, the test result shall be the average value of the corrected braking distance (see [4.6.3.9](#)) of the test results of either [4.6.3.8](#) item a) 1) or [4.6.3.8](#) item b) 1).

For compliance with the requirements of ISO 4210-2:2014, 4.6.8.1.1 the above average values shall not exceed the relevant braking distances specified in ISO 4210-2:2014, Table 2.

- b) Braking under wet conditions

Depending on the gradient of the test track, the test result shall be the average value of the corrected braking distances (see [4.6.3.9](#)) of the test results of either [4.6.3.8](#) item a) 3) or [4.6.3.8](#) item b) 3).

For compliance with the requirements of ISO 4210-2:2014, 4.6.8.1.1, the above average values shall not exceed the relevant braking distances specified in ISO 4210-2:2014, Table 2.

- c) Ratio between wet and dry braking performance for city and trekking, young adult and mountain bicycles

Because the wet and dry braking distances are measured at different test velocities, a simple comparison of braking distances is not meaningful. Therefore, a comparison shall be made of equivalent, calculated values, using Formula (2):

$$\frac{16^2}{S_c^W} : \frac{25^2}{S_c^D} \quad (2)$$

where

S_c^D is the corrected braking distance in dry conditions (m);

S_c^W is the corrected braking distance in wet conditions (m).

4.6.4 Back-pedal brake linearity test

This test shall be conducted on a fully assembled bicycle. The output force for a back-pedal brake shall be measured tangentially to the circumference of the rear tyre, when the wheel is rotated in the direction

of forward movement, while a force of between 90 N and 300 N is being applied to the pedal at right angles to the crank and in the direction of braking.

The braking force reading shall be taken during a steady pull and after one revolution of the wheel. A minimum of five results, each at a different pedal force level, shall be taken. Each result shall be the average of three individual readings at the same load level.

The results shall be plotted on a graph, showing the line of best fit and the $\pm 20\%$ limit lines obtained by the method of least squares outlined in [Annex A](#).

4.6.5 Machine test method

4.6.5.1 General

The test machine enables the braking distances for both brakes or the rear brake alone to be calculated from measurements of the individual braking forces of the front and rear brakes on a drum or belt.

4.6.5.2 Symbols

F_{Op}	Operating force (i.e. force applied on brake lever or pedal)
$F_{Op \text{ intend}}$	Intended operating force (e.g. 40 N, 60 N, 80 N etc.)
$F_{Op \text{ rec}}$	Recorded operating force (e.g. 38 N, 61 N, 79 N etc.)
F_{Br}	Braking force
$F_{Br \text{ rec}}$	Recorded braking force
$F_{Br \text{ corr}}$	Corrected braking force (Corrected for difference between $F_{Op \text{ intend}}$ and $F_{Op \text{ rec}}$)
$F_{Br \text{ average}}$	Arithmetic mean of the three $F_{Br \text{ corr}}$ at one level of $F_{Op \text{ intend}}$
$F_{Br \text{ max}}$	Maximum $F_{Br \text{ average}}$
F_{Br}^D	Dry braking force
$F_{Br \text{ W}}$	Wet braking force

4.6.5.3 Linearity

When tested by the methods described in [4.6.5.7](#) item c) 1) and 2), the braking force $F_{Br \text{ average}}$ shall be linearly proportional (within $\pm 20\%$) to the progressively increasing intended operating forces $F_{Op \text{ intend}}$. The requirement applies to braking forces $F_{Br \text{ average}}$ equal to and greater than 80 N (see [Annex A](#)).

4.6.5.4 Test machine

The test machine shall incorporate a system that drives the wheel during the test by tyre contact and a means of measuring the braking force, and typical examples of two types of machine are illustrated in [Figures 14](#) and [15](#).

[Figure 14](#) shows a machine in which a roller drives the individual wheels, and [Figure 15](#) shows a machine in which a driven belt contacts both wheels. Other types of machine are permitted, provided they meet the specific requirements listed below and those specified in [4.6.5.5](#) and [4.6.5.6](#).

The specific requirements are as follows:

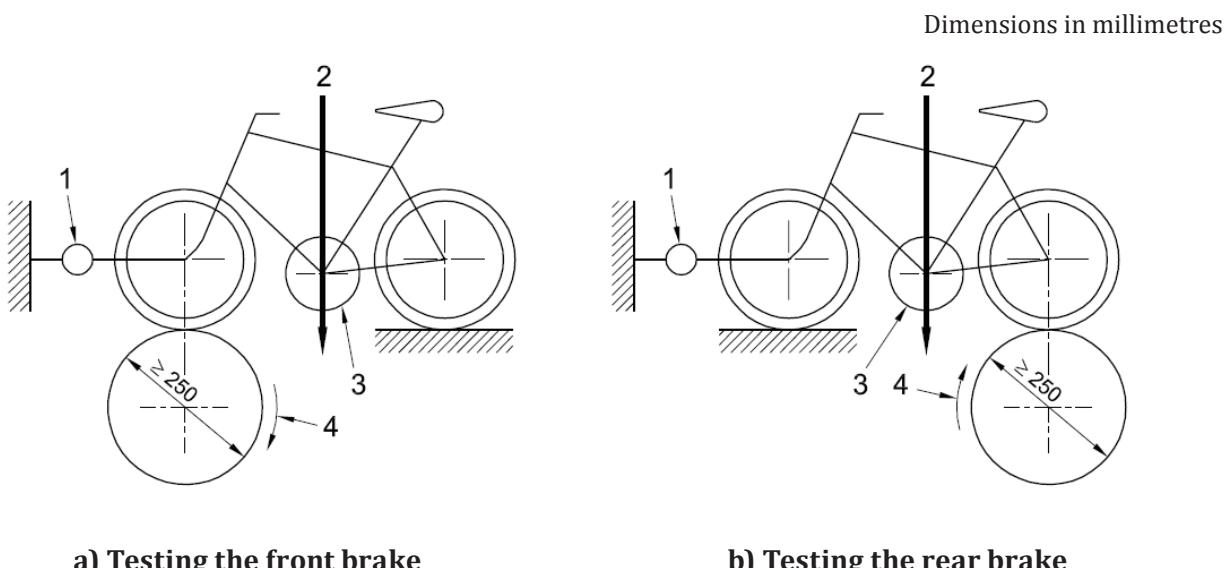

- the linear surface velocity of the tyre shall be 12,5 km/h and shall be controlled within $\pm 5\%$;

- b) a means of laterally restraining the wheel under test shall be provided which does not influence the measurement of braking force;
- c) a means of laterally applying forces to the brake levers at the point specified in [Figure 5](#) shall be provided, with the width of the contact on the lever not greater than 5 mm. In the case of back-pedal brakes, a means of applying forces to a pedal is also required.

4.6.5.5 Instrumentation

The test machine shall be instrumented to include the following:

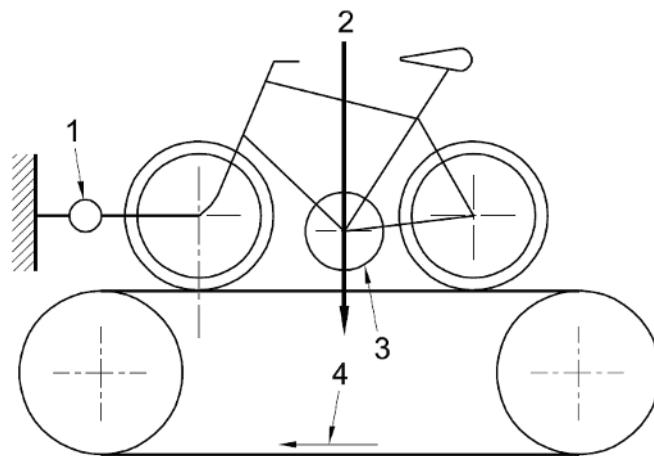

- a) a device to record the surface velocity of the tyre, accurate to within $\pm 2\%$;
- b) a device to record the braking force (see [Figures 14](#) and [15](#), for example), accurate to within $\pm 5\%$;
- c) a device to record the operating force applied to the hand lever or pedal, accurate to within $\pm 1\%$;
- d) a water spray system, to provide wetting of the brakes of the bicycle, consisting of a water reservoir connected by tubing to a pair of nozzles arranged as shown in [Figure 16](#). Each nozzle shall provide a flow of water at ambient temperature of not less than 4 ml/s. The wheel shall be suitably enclosed to ensure that, in addition to the rim, any hub- or disc-brake is thoroughly wetted before a test begins;
- e) a system for loading the wheels of the bicycle against the driving mechanism (see [4.6.5.6](#)).

4.6.5.6 Vertical force on the tested wheel

The wheel to be tested shall be forced vertically downwards so that no skidding of the wheel occurs when tested according to [4.6.5.7 item c\) 1\) and 2\)](#). The necessary force can be applied anywhere on the bicycle (wheel axle, bottom bracket, seat-post, etc.) provided that it is exerted vertically downwards.

4.6.5.7 Test method

a) General

Test the front and rear wheels individually.

b) Running-in the braking surfaces

Conduct a running-in process on every brake before the performance test is performed.

In order to determine the operating force to be used during the running-in process, mount and load the bicycle on the test machine with the belt or drum running at the specified speed and apply an operating force to the brake lever or the pedal that is high enough to achieve a braking force

of $200\text{ N} \pm 10\%$. Maintain this operating force for at least 2,5 s, and note the value of the applied operating force.

Repeat the procedure (applying the operating force determined in the paragraph above accurate to within $\pm 5\%$) 10 times, or with more repetitions if necessary, until the mean braking force from anyone of the three latest tests does not deviate by more than $\pm 10\%$ from the mean braking force from these same three tests.

c) The performance tests

1) Testing under dry conditions

For hand-operated brakes, with a vertical force applied to the bicycle sufficient to prevent skidding of the tyre on the wheel under test, accelerate the driving mechanism to the specified velocity, then apply the operating force in a series of 20 N increments from 40 N to either 180 N (in case of young adult bicycles, apply to 120 N) or to the force necessary to achieve a braking force of at least 700 N, whichever is the lesser. However, if the wheel locks, if any possible brake-overload device is actuated, or if the hand lever comes into contact with the handlebar, do not increase the force further. For each increment of applied operating force, perform three tests within 1 min. Before applying the next level of operating force, allow the brake to cool for 1 min.

For back-pedal brakes, with a vertical force applied to the bicycle sufficient to prevent skidding of the tyre on the wheel under test, accelerate the driving mechanism to the specified velocity, then apply the operating force in a series of 50 N increments from 100 N to either 350 N or to the force necessary to achieve a braking force of at least 400 N, whichever is the lesser. However, if the wheel locks, if any possible brake-overload device is actuated, do not increase the force further. For each increment of applied operating force, perform three tests within 1 min. Before applying the next level of operating force, allow the brake to cool for 1 min.

The applied operating forces shall lie within $\pm 10\%$ of the intended operating forces, shall be applied as specified in [Figures 5 and 6](#) and [4.6.5.4 item c\)](#), shall be recorded with an accuracy of $\pm 1\%$, and shall be fully applied within 1,0 s of the commencement of braking.

For each increment of operating force, record the braking force value, $F_{Br\ rec}$, for a period of between 2,0 s and 2,5 s, with measurement starting 0,5 s to 1,0 s after the commencement of braking. Record $F_{Br\ rec}$ as the average braking force during this measurement period.

The time at which the measurement of the braking force is started shall be related to the speed at which the operating force is applied. If the operating force is fully applied in less than 0,5 s after the commencement of braking, start the measurement after 0,5 s. However, if the operating force is fully applied between 0,5 s and 1,0 s after the commencement of braking, start the measurement when the operating force is fully applied.

2) Testing under wet conditions

The method shall be as given in [4.6.5.7 item c\) 1\)](#) with the addition that wetting of the brake system shall commence not less than 5,0 s before the commencement of braking and shall continue until the measurement period has ended.

Water nozzles shall be arranged according to [Figure 16](#).

d) Correction of braking force

Each recorded braking force, $F_{Br\ rec}$, shall be corrected for any difference between the recorded operating force and the intended operating force. The corrected braking force shall be calculated by multiplying the recorded braking force, $F_{Br\ rec}$, with a correction factor which is the ratio between the intended operating force, $F_{Op\ intend}$, and the recorded operating force, $F_{Op\ rec}$.

EXAMPLE Recorded braking force $F_{Br\ rec} = 225\text{ N}$

Intended operating force $F_{Op\ intend} = 180\text{ N}$

Recorded operating force $F_{Op\ rec}$ = 184 N

Correction factor = 180/184

Corrected braking force $F_{Br\ corr}$ = $225 \times (180/184)$

e) Test results

Select from the record the maximum output braking force, $F_{Br\ max}$, for each combination of wheel (front or rear) and each test condition (wet or dry).

The braking performance value shall be calculated using Formula (3):

$$B_p = F_{Br\ max} \times \frac{m}{M} \quad (3)$$

where

B_p is the braking performance value (N);

$F_{Br\ max}$ is the maximum F_{Br} average (N);

m is the standard mass of the bicycle defined as 100 kg for adult bicycle and 60 kg for young adult bicycle (kg);

M is the maximum permissible total mass specified by the manufacturer in ISO 4210-2:2014, Clause 5 item h) (kg).

Where a manufacturer specifies that his bicycle can carry a mass such that the sum of that mass plus the mass of the bicycle is in excess of 100 kg (60 kg for young adults) to some value M, apply M as total weight.

f) Linearity

Plot the calculated F_{Br} average values (the arithmetic mean of the three corrected braking forces at each level of operating force) against the equivalent operating force values, $F_{Op\ intend}$, in order to assess the linearity against the requirement in [4.6.5.3](#). Plot the results on a graph, showing the line of best fit and the $\pm 20\%$ limit lines obtained by the method of least squares outlined in [Annex A](#).

g) Ratio between wet and dry braking for city and trekking, young adult, and mountain bicycles

For any operating force (F_{Op}) for which the measured dry braking force ($F_{Br\ average}^D$) is greater than 200 N, the ratio between the measured braking force in wet conditions ($F_{Br\ average}^W$) and the measured braking force in dry conditions ($F_{Br\ average}^D$) shall be greater than 40 %.

For each F_{Op} where $F_{Br\ average}^D > 200$ N, determine] whether or not the requirements of have been met using Formula (4):

$$\frac{F_{Br\ average}^W}{F_{Br\ average}^D} \quad (4)$$

For symbols see [4.6.5.2](#).

h) Simple track test (see ISO 4210-2:2014, 4.19)

After completion of the machine test, conduct a brief, simple track test with progressively increasing operating forces to determine whether or not the brakes bring the bicycle to a smooth, safe stop.

NOTE This test can be combined with the test on the fully assembled bicycle.

4.7 Brakes — Heat-resistance test

Drive the wheel and tyre assembly with the brake applied on a machine such as those described in [4.6.5.5](#) at a velocity of 12,5 km/h ± 5 % with a rearward, cooling air-velocity of 12,5 km/h ± 10 %, so that a total braking energy of E Wh ± 5 % specified in [Table 1](#) is developed. The duration of the test shall be 15 min ± 2 min.

Allow the brake to cool to ambient temperature and then repeat the test cycle.

A maximum of 10 interruptions per test cycle is permitted, each with a maximum duration of 10 s.

When the test has been carried out, subject the brakes to the applicable parts of the tests described in [4.6.5.7](#) item c) 1) and 2).

Calculate the braking energy from Formula (5):

$$E = F_{Br} \times V_{Br} \times T \text{ (Wh)} \quad (5)$$

where

F_{Br} is the braking force (N);

V_{Br} is the linear velocity of the periphery of the tyre (i.e. 12,5 km/h = 3,472 m/s) (m/s);

T is the duration of each test cycle (excluding interruptions) (i.e. 15 min = 0,25 h) (h).

Table 1 — Total braking energy

Bicycle type	City and trekking bicycles	Young adult bicycles	Mountain bicycles	Racing bicycles
Total braking energy, E Wh	55	55	75	75

When the test has been carried out, the brakes shall be subjected to the applicable parts of the test described in [4.6.5](#), in order to check that the requirement in ISO 4210-2:2014, 4.6.9.2 is fulfilled.

Annex A (informative)

Explanation of the method of least squares for obtaining the line of best fit and $\pm 20\%$ limit lines for braking performance linearity

The readings taken in the test specified in [4.6.5.7](#) can be expected to lie near some straight line that can be drawn through them. Although in practice one might draw a good straight line through the points by eye, the method of least squares given here provides a criterion for minimizing the discrepancies and permits a line to be selected that has a claim to be called the best fit.

The line of best fit is the line that minimizes the sum of the squares of the differences between the observed results and the corresponding results predicted by the line.

The relationship between the variables is considered to be of the form

$$y = a + bx \quad (\text{A.1})$$

where

- x is the independent variable, and is known precisely (in this case, the load applied to the pedal);
- y is the dependent variable, and is observed but with a degree of uncertainty (in this case, the braking force at the wheel).

a and b are unknown constants and have to be estimated.

For a series of n readings, this relationship can be resolved by taking a minimum of the sum of the squares of the difference to give

$$b = \frac{n \sum xy - \sum x \sum y}{n \sum x^2 - \sum x \sum x} \quad (\text{A.2})$$

Taking

$$\bar{y} = \frac{\sum y}{n} \text{ and } \bar{x} = \frac{\sum x}{n} \quad (\text{A.3})$$

$$b = \frac{\sum xy - \bar{y} \sum x}{\sum x^2 - \bar{x} \sum x} \quad (\text{A.4})$$

Then a can be found by substitution:

$$a = \bar{y} - b\bar{x} \quad (\text{A.5})$$

For example, the following four values of x and y are noted during a test, from which $\sum xy$, $\sum x^2$, \bar{x} and \bar{y} are calculated as shown:

No.	<i>x</i> (pedal force)	<i>y</i> (braking force)
	N	N
1	90	90
2	150	120
3	230	160
4	300	220
Sum	$\sum x = 770$	$\sum y = 590$
Mean	$\bar{x} = 192,5$	$\bar{y} = 147,5$

No.	<i>xy</i>	<i>x</i> ²
1	8 100	8 100
2	18 000	22 500
3	36 800	52 900
4	66 000	90 000
Sum	$\sum xy = 128\ 900$	$\sum x^2 = 173\ 500$

$$\begin{aligned}
 b &= \frac{\sum xy - \bar{y} \sum x}{\sum x^2 - \bar{x} \sum x} \\
 &= \frac{128\ 900 - (147,5 \times 770)}{173\ 500 - (192,5 \times 770)} \\
 &= 0,606
 \end{aligned}$$

$$\begin{aligned}
 a &= \bar{y} - b\bar{x} \\
 &= 147,5 - (0,606 \times 192,5) \\
 &= 30,8
 \end{aligned}$$

The line of best fit is therefore

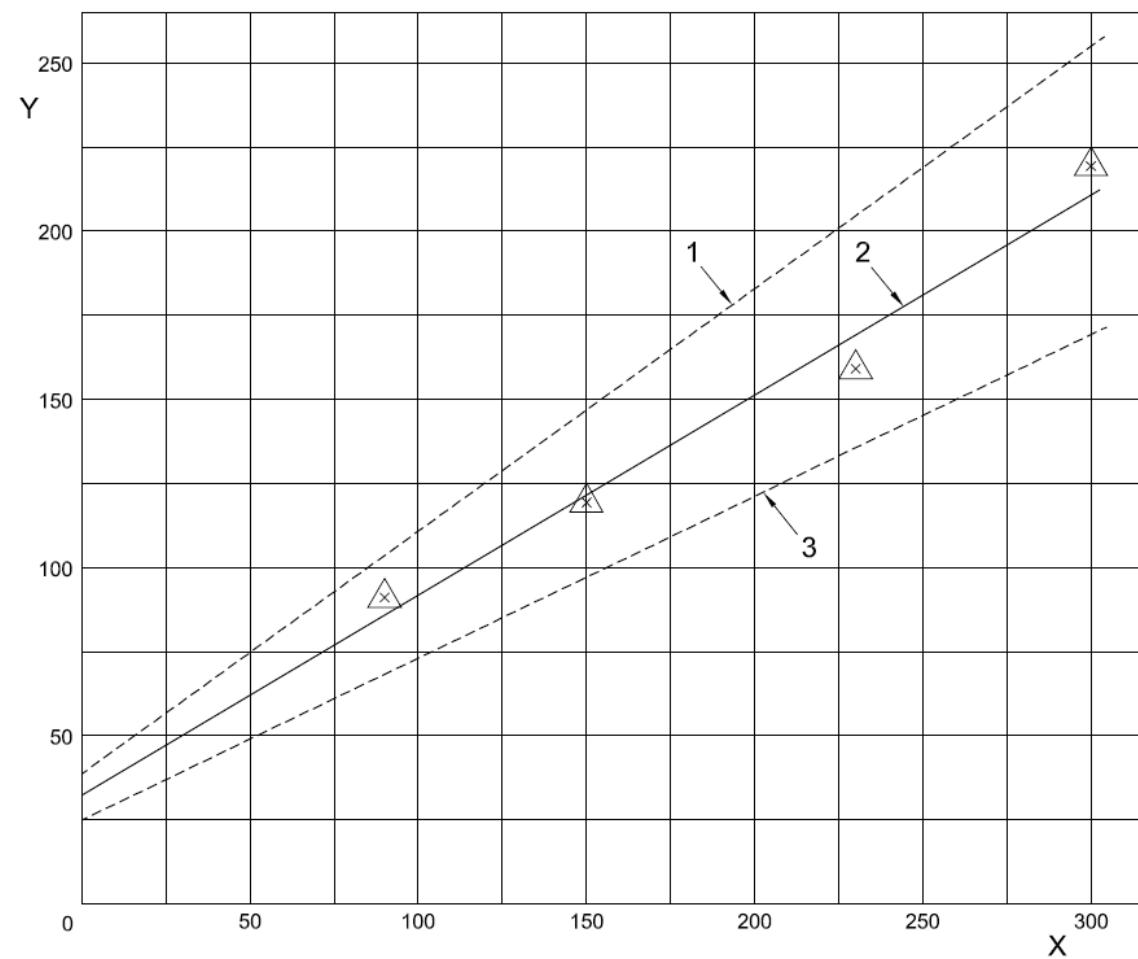

$$y = 30,8 + 0,606x$$

and the $\pm 20\%$ limit lines are

$$\begin{aligned}
 y_{\text{lower}} &= \frac{80}{100} (30,8 + 0,606x) \\
 &= 24,64 + 0,485x
 \end{aligned}$$

$$\begin{aligned}
 y_{\text{upper}} &= \frac{120}{100} (30,8 + 0,606x) \\
 &= 36,96 + 0,727x
 \end{aligned}$$

The results from the example are shown graphically in [Figure A.1](#).

British Standards Institution (BSI)

BSI is the national body responsible for preparing British Standards and other standards-related publications, information and services.

BSI is incorporated by Royal Charter. British Standards and other standardization products are published by BSI Standards Limited.

About us

We bring together business, industry, government, consumers, innovators and others to shape their combined experience and expertise into standards-based solutions.

The knowledge embodied in our standards has been carefully assembled in a dependable format and refined through our open consultation process. Organizations of all sizes and across all sectors choose standards to help them achieve their goals.

Information on standards

We can provide you with the knowledge that your organization needs to succeed. Find out more about British Standards by visiting our website at bsigroup.com/standards or contacting our Customer Services team or Knowledge Centre.

Buying standards

You can buy and download PDF versions of BSI publications, including British and adopted European and international standards, through our website at bsigroup.com/shop, where hard copies can also be purchased.

If you need international and foreign standards from other Standards Development Organizations, hard copies can be ordered from our Customer Services team.

Subscriptions

Our range of subscription services are designed to make using standards easier for you. For further information on our subscription products go to bsigroup.com/subscriptions.

With **British Standards Online (BSOL)** you'll have instant access to over 55,000 British and adopted European and international standards from your desktop. It's available 24/7 and is refreshed daily so you'll always be up to date.

You can keep in touch with standards developments and receive substantial discounts on the purchase price of standards, both in single copy and subscription format, by becoming a **BSI Subscribing Member**.

PLUS is an updating service exclusive to BSI Subscribing Members. You will automatically receive the latest hard copy of your standards when they're revised or replaced.

To find out more about becoming a BSI Subscribing Member and the benefits of membership, please visit bsigroup.com/shop.

With a **Multi-User Network Licence (MUNL)** you are able to host standards publications on your intranet. Licences can cover as few or as many users as you wish. With updates supplied as soon as they're available, you can be sure your documentation is current. For further information, email bsmusales@bsigroup.com.

BSI Group Headquarters

389 Chiswick High Road London W4 4AL UK

Rewvisions

Our British Standards and other publications are updated by amendment or revision.

We continually improve the quality of our products and services to benefit your business. If you find an inaccuracy or ambiguity within a British Standard or other BSI publication please inform the Knowledge Centre.

Copyright

All the data, software and documentation set out in all British Standards and other BSI publications are the property of and copyrighted by BSI, or some person or entity that owns copyright in the information used (such as the international standardization bodies) and has formally licensed such information to BSI for commercial publication and use.
